

Request for Proposal – One (1) New Custom Triple Combination Fire Engine

Addendum # 4

Issued – January 11, 2019

Closing Date – January 23, 2019

The following is provided for clarification as to the purpose of Specification 12.47 (page 90) of the above noted RFP document

Warm water rinse outlet: In accordance to NFPA, “The National Institute for Occupational Safety and Health (NIOSH) recently undertook two large studies focused on firefighter cancer and concluded that firefighters face a 9 percent increase in cancer diagnoses, and a 14 percent increase in cancer-related deaths, compared to the general population of the U.S.”

Providing fire fighters the opportunity to their wash hands and neck area with warm water, while on scene, quickly assists in the removal of smoke and soot containing carcinogens. Further, immediately washing of hands also increases the reduction of contracting infection in which firefighters could be periodically exposed to.

In summary, the purpose of this specification is to provide an on scene source of warm water for use by fire fighters for the above noted purpose(s) and is not intended to be a high volume supply.
